The present invention relates to a process for preparation of substantially pure piperidine derivative compounds of the formulae: 

\[
\text{or}
\]

wherein

- \( R_1 \) is hydrogen or hydroxy;
- \( R_2 \) is hydrogen;
- or \( R_1 \) and \( R_2 \) taken together form a second bond between the carbon atoms bearing \( R_1 \) and \( R_2 \);
- \( R_3 \) is \(-\text{COOH} \) or \(-\text{COO}^-\);
- \( R_4 \) has 1 to 6 carbon atoms;
- A, B, and D are the substituents of their respective rings each of which may be different or the same and are hydrogen, halogens, alkyl, hydroxy, alkoxy, or other substituents.

PIPERIDINE DERIVATIVES AND PROCESS FOR THEIR PRODUCTION

This is a continuation of application Ser. No. 08/083,102 filed Jun. 24, 1993 now abandoned.

FIELD OF THE INVENTION

The present invention relates to piperidine derivatives and a process for their production.

BACKGROUND OF THE INVENTION

Terfenadine. 1-(p-tert-butyphenyl)-4-[(α-hydroxydiphenylmethyl)-1-piperidinyl]-butanol is a non-sedating anti-histamine. It is reported to be a specific H 1-receptor antagonist that also deoid of any anti-cholinergic, anti-serotoninergic, and anti-adrenergic effects both in vitro and in vivo. See D. McTavish, K. L. Goa, M. Ferrill. Drugs, 1990, 39, 552; C. R. Kingsolving, N. L. Monroe, A. A. Carr. Pharmacologist, 1973, 15, 221; J. K. Woodward, N. L. Munro, Arch Pharm, 1982, 32, 1154; K. V. Mann, K. J. Tietze. Clin Pharm, 1989, 6, 331. A great deal of effort has been made investigating structure-activity relationships of terfenadine analogs, and this is reflected in the large number of U.S. patents disclosing this compound and related structures as follows:

U.S. Pat. No. 3,687,956 to Zivkovic
U.S. Pat. No. 3,806,526 to Carr. et. al.
U.S. Pat. No. 3,829,433 to Carr. et. al.
U.S. Pat. No. 3,862,173 to Carr. et. al.
U.S. Pat. No. 3,878,217 to Carr. et. al.
U.S. Pat. No. 3,922,276 to Duncan, et. al.
U.S. Pat. No. 3,931,497 to Carr. et. al.
U.S. Pat. No. 3,941,795 to Carr. et. al.
U.S. Pat. No. 3,946,022 to Carr. et. al.
U.S. Pat. No. 3,956,296 to Duncan, et. al.
U.S. Pat. No. 3,965,257 to Carr. et. al.
U.S. Pat. No. 4,742,175 to Fawcett, et. al.

Terfenadine has been linked to potentially fatal abnormal heart rhythms in some patients with liver disease or who also take the anti-fungal drug ketoconazole or the antibiotic erythromycin. In animal and human metabolic studies, terfenadine was shown to undergo high first-pass effect, which results in readily measurable plasma concentrations of the major metabolite 4-[4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-1-hydroxybutyl]-o,a-dimethylenylacetic acid, also known as terfenadine carboxylic acid metabolite. The terfenadine carboxylic acid metabolite also possesses anti-histaminic activity in animal models and may lack the cardiac side effects seen with terfenadine.

Piperidine derivatives related to the terfenadine carboxylic acid metabolite are disclosed in the following U.S. patents:

U.S. Pat. No. 4,254,129 to Carr. et. al.
U.S. Pat. No. 4,254,130 to Carr. et. al.
U.S. Pat. No. 4,285,957 to Carr. et. al.
U.S. Pat. No. 4,285,958 to Carr. et. al.

In these patents, 4-[4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-1-hydroxybutyl]-o,a-dimethylenylacetic acid and related compounds are prepared by alkylation of a substituted piperidine derivative of the formula:
A second mixture of aromatic regioisomers is obtained of the formula:

\[
\begin{align*}
\text{C} & \quad \text{R}_1 \\
\text{C} & \quad \text{R}_2 \\
\text{N} & \quad \text{O} \\
(\text{CH}_2)_n & \quad \text{C} - \text{COOCH}_3
\end{align*}
\]

wherein the monosubstituted meta, para mixture of regioisomers is obtained.

It is known in the art that a monoalkyl substituent on a benzene ring is ortho, para directing in electrophilic aromatic substitution reactions such as a Friedel-Crafts reaction. Thus, it would be expected that the Friedel-Crafts reaction of \( \alpha \)-chlorobutyryl chloride with ethyl \( \alpha,\alpha \)-dimethylphenylacetate would yield predominantly the para substituted product of the formula:

\[
\text{Cl} - (\text{CH}_2)_n - \text{C} - \text{COOCH}_3
\]

because of the electron donating, para-directing character of the dimethylalkyl substituent combined with the steric hindrance associated with reaction of theortho positions. In practice, the inductive electronic withdrawing effect of the carboxylic ester of ethyl \( \alpha,\alpha \)-dimethylphenylacetate counteracts the expected alkyl electron donating effect, resulting in no significant directing effect for the aromatic substitution reaction. For the described reaction, a statistical mixture of meta to para regioisomers results, with the two meta positions predominating.

The above second mixture of regioisomers can be converted to a third mixture of regioisomers of formula:

\[
\text{C} - \text{R}_1 \\
\text{C} - \text{R}_2 \\
\text{C} - \text{COOH} \\
(\text{CH}_2)_n - \text{CH} - \text{C} - \text{COOR}_4
\]

Although the second mixture of regioisomers and the third mixture of regioisomers can be analyzed by HPLC experiments, a practical separation to obtain gram quantities of substantially pure regioisomers has not been achieved.

Each mixture (including the first), would be expected to contain 33% of the para isomer and 67% of the meta isomer. Since these components are inseparable, it has not been possible to obtain either of the regioisomers in each mixture in substantially pure form.

**SUMMARY OF THE INVENTION**

The present invention relates to substantially pure piperidine derivative compounds of the formulae:

\[
\begin{align*}
\text{C} & \quad \text{R}_1 \\
\text{C} & \quad \text{R}_2 \\
\text{C} & \quad \text{R}_3 \\
\text{C} & \quad \text{R}_4
\end{align*}
\]

wherein

- \( R_1 \) is hydrogen or hydroxy;
- \( R_2 \) is hydrogen;
- or \( R_1 \) and \( R_2 \) taken together form a second bond between the carbon atoms bearing \( R_1 \) and \( R_2 \);
- \( R_3 \) is \(-\text{COOH}\) or \(-\text{COOR}_4\);
- \( R_4 \) is an alkyl with 1 to 6 carbon atoms;
A. B. and D are the substituents of their rings, each of which may be different or the same, and are selected from the group consisting of hydrogen, halogens, alkyl, hydroxy, alkoxy, or other substituents or a salt thereof. These compounds are useful in pharmaceutical compositions, particularly as antihistamines, antiallergy agents, and bronchodilators.

The piperidine derivative compound is prepared by a process which is initiated by providing a substantially pure regioisomer of the following formula:

![Chemical structure](image)

The substantially pure regioisomer is converted to the piperidine derivative having a keto group with a piperidine compound of the formula:

![Chemical structure](image)

A number of synthetic pathways for preparing the substantially pure regioisomer and for reacting it with the piperidine compound having a keto group are disclosed. The piperidine derivative having a keto group can be converted to the above piperidine derivative having a hydroxyl group by reduction.

Although a wide variety of piperidine derivatives can be produced by the process of the present invention, it is particularly useful in forming a hydroxylated piperidine derivative of the formula:

![Chemical structure](image)

wherein

- $R_4$ is hydrogen or hydroxy;
- $R_3$ is hydrogen;
- or $R_1$ and $R_2$ taken together form a second bond between the carbon atoms bearing $R_1$ and $R_2$;
- $R_3$ is $-$COOH or $-$COOR$_4$;
- $R_4$ is an alkyl with 1 to 6 carbon atoms;
- A, B, and D are the substituents of their rings, each of which may be different or the same, and are selected from the group consisting of hydrogen, halogens, alkyl, hydroxy, alkoxy, or other substituents or a salt thereof.

Alternatively, the process of the present invention can be used to produce a piperidine derivative with a keto group of the following formula:
These substantially pure piperidine derivative compounds may be in the form of 4-diphenylmethylpiperidine derivatives represented by the following formulae:

where A, B, D, R₃ are defined above. Another useful class of piperidine derivative compounds are 4-diphenylmethylenepiperidine derivatives in accordance with the following formulae:

where A, B, D, R₃ are defined above. The substantially pure piperidine derivative compounds include 4-(hydroxydiphenylmethyl)piperidine derivatives according to the following formulae:

where A, B, D, R₃ are defined above. Examples of R₄ are straight or branched alkyl groups, including methyl, ethyl, n-propyl, isopropyl, n-butyl, sec-butyl, tert-butyl, n-pentyl, neopentyl, and n-hexyl groups.

Illustrative examples of compounds of the present invention are as follows:

4-[[4-([4-(hydroxydiphenylmethyl)]-1-piperidinyl)-1-hydroxybutyl]-α,α-dimethylbenzeneacetic acid;

4-[[4-([4-(diphenylmethyl)]-1-piperidinyl)-1-hydroxybutyl]-α,α-dimethylbenzeneacetic acid;
Particularly preferred are compounds of the formulae:

Optionally, both diphenyl groups from the piperidine compound may be alkyl (e.g., methyl) substituted at the position para to the methylene.

This invention also includes pharmaceutically acceptable salts in the form of inorganic or organic acid or base addition salts of the above compounds. Suitable inorganic acids are, for example, hydrochloric, hydrobromic, sulfuric, and phosphoric acids. Suitable organic acids include carboxylic acids, such as, acetic, propionic, glycolic, lactic, pyruvic, malonic, succinic, fumaric, malic, tartaric, citric, cyclamic, ascorbic, maleic, hydromaleic, dihydroxymaleic, benzoic, phenylactic, 4-aminobenzoic, anthranillic, cinnamic, salicylic, 4-aminosalicylic, 2-phenoxybenzoic, 2-acetoxbenzoic, and mandelic acid. Sulfonic acids, such as, methane sulfonic, ethane sulfonic, and hydroxyethanesulfonic acid are also suitable acids. Non-toxic salts of the compounds of the above-identified formulas formed with inorganic and organic bases include, for example, those alkali metals, such as, sodium, potassium, and lithium, alkaline earth metals, for example, calcium and magnesium, light metals of group IA, for example, aluminum, organic amines such as, primary, secondary, or tertiary amines, for example, cyclohexylamine, ethylamine, pyridine, methylaminoethanol, and piperazine. These salts are prepared by conventional means, for example, by treating the piperidine derivative compounds of the formula:
where \( R_1, R_2, \) and \( R_3 \) are defined above, with an appropriate acid or base.

The piperidine derivative compounds of the present invention can be utilized as the biologically active components in pharmaceutical compositions. The compounds of this invention are useful as antihistamines, antiallergy agents, and bronchodilators. They may be administered alone or with suitable pharmaceutical carriers, and can be in solid or liquid form such as, tablets, capsules, powders, solutions, suspensions or emulsions.

The compounds of this invention can be administered orally, parenterally, for example, subcutaneously, intravenously, intramuscularly, intraperitoneally, by intranasal instillation or by application to mucous membranes, such as, that of the nose, throat and bronchial tubes. Such application to mucous membranes can be achieved with an aerosol spray containing small particles of a compound of this invention in a spray or dry powder form.

The quantity of the compound of the present invention administered will vary depending on the patient and the mode of administration and can be any effective amount. The quantity of the compound administered may vary over a wide range to provide in a unit dosage an effective amount of from about 0.01 to 20 mg/kg of body weight of the patient per day to achieve the desired effect. For example, the desired antihistamine, antiallergy, and bronchodilator effects can be obtained by consumption of a unit dosage form such as a tablet containing 1 to 50 mg of the compound of the present invention taken 1 to 4 times daily.

The solid unit dosage forms can be of the conventional type. This, the solid form can be a capsule, such as an ordinary gelatin type containing the compound of the present invention and a carrier, for example, lubricants and inert fillers such as, lactose, sucrose, or cornstarch. In another embodiment, these compounds are tableted with conventional tablet bases such as lactose, sucrose, or cornstarch in combination with binders like acacia, cornstarch, or gelatin, disintegrating agents such as, cornstarch, potato starch, or alginic acid, and a lubricant like stearic acid or magnesium stearate.

The compounds of this invention may also be administered in injectable dosages by solution or suspension of the compounds of the present invention in a physiologically acceptable diluent with a pharmaceutical carrier. Such carriers include sterile liquids such as water and oils, with or without the addition of a surfactant and other pharmaceutically acceptable adjuvants. Illustrative oils are those of petroleum, animal, vegetable, or synthetic origin, for example, peanut oil, soybean oil, or mineral oil. In general, water, saline, aqueous dextrose and related sugar solutions, and glycols such as, propylene glycol or polyethylene glycol, are preferred liquid carriers, particularly for injectable solutions.

For use as aerosols the compounds of this invention in solution or suspension may be packaged in a pressurized aerosol container together with suitable propellants, for example, hydrocarbon propellants like propane, butane, or isobutane with conventional adjuvants. The compounds of the present invention also may be administered in a non-pressurized form such as in a nebulizer or atomizer. The compounds of the present invention can be used to treat warm blooded animals, birds, and mammals. Examples of such beings include humans, cats, dogs, horses, sheep, cows, pigs, lambs, rats, mice, and guinea pigs.

The piperidine derivative compounds of the present invention are prepared by providing a substantially pure regioisomer of the following formula:
wherein

$$R_3 = \text{OR}, \quad -\text{N}(R_3)_2, \quad \text{and} \quad -\text{SR}, \quad \text{and} \quad R_4 \quad \text{is an alkyl with 1 to 6 carbons.}$$

with a compound of the formula:

$$\begin{array}{c}
\text{CH}_3 \\
\text{CH}_3 \\
\text{Cl} \\
\text{COX}
\end{array}$$

wherein

$$X \quad \text{is a halogen.}$$

under conditions effective to produce a first mixture of regioisomers of the formula:

$$\begin{array}{c}
\text{CH}_3 \\
\text{CH}_3 \\
\text{Cl} \\
\text{C} = \text{COR}_5
\end{array}$$

Such conditions include those conventionally utilized in a Friedel-Crafts acylation reaction catalyzed by, for example, AlCl$_3$. The reaction is carried out in a solvent such as, carbon disulfide, tetrachloroethane, or nitrobenzene with carbon disulfide being the preferred solvent. The reaction is carried out for a time period of $\frac{1}{2}$ to 12 hours, preferably 3 to 5 hours, at a temperature of 0 to 25°C.

The first mixture of regioisomers can be hydrolyzed under conditions effective to form a second mixture of regioisomers of the formula:

$$\begin{array}{c}
\text{CH}_3 \\
\text{CH}_3 \\
\text{Cl} \\
\text{C} = \text{COR}_5
\end{array}$$

Typically this reaction is carried out by base hydrolysis procedures which are well known in the art. For example, the first mixture of regioisomers can be treated with an inorganic base, such as, sodium hydroxide or potassium hydroxide, in an aqueous lower alcohol solvent. Suitable solvents include aqueous methanol, ethanol, isopropanol, or n-butanol solutions. Hydrolysis is carried out at reflux temperatures of the solvent for $\frac{1}{2}$ to 12 hours.

Following such hydrolyzation, the substantially pure regioisomer of the formula:

$$\begin{array}{c}
\text{A} \\
\text{O} \\
\text{C} = \text{COOH}
\end{array}$$

by procedures well known in the art. Typically, such conversion is accomplished by treatment with acid.

Process Two For Producing Substantially Pure Regioisomer

In another embodiment of the process of the present invention, the substantially pure regioisomer is produced by acylating a starting compound of the formula:

$$\begin{array}{c}
\text{A} \\
\text{X} \\
\text{R_3}
\end{array}$$

wherein

$$R_3 = \text{COOH}, \quad -\text{COOalkyl}, \quad -\text{CON(alkyl)}_2, \quad \text{COSalkyl}$$

where the alkyl moieties have 1 to 6 carbon atoms and are straight or branched with a compound of the formula:
5.750.703

with a compound of the formula:

\[
\begin{array}{c}
\text{Cl} - \text{C} = \text{O} \\
\end{array}
\]

under conditions effective to produce a first mixture of regioisomers of the formula:

\[
\begin{array}{c}
\text{O} \\
\end{array}
\]

Typically, such acylation is carried out by a Friedel-Crafts reaction, as described above in Process One for Producing Substantially Pure Regioisomers.

Once the substantially pure regioisomer of the present invention is produced by one of the above (or some other) process, there are a number of procedures for using that compound to produce the piperidine derivatives of the present invention.

Process Three For Producing Substantially Pure Regioisomer

Suitable halogens include chlorine, bromine, and iodine. Suitable conditions for carrying out such halogenating include reacting the substantially pure regioisomer with a halogen nucleophile and a Lewis Acid. The ring opening reaction is carried out in a suitable solvent, optionally in the presence of a catalytic amount of base for about 0.5 to 24 hours and a temperature of about 40 degrees C to the reflux temperature of the solvent. Suitable halogen nucleophiles include sodium iodide, sodium bromide, potassium iodide, potassium bromide, cesium iodide, cesium bromide, trimethylsilyl iodide, manganese iodide, cerium iodide, cerium bromide, magnesium iodide, magnesium carbonate, calcium bromide, and calcium iodide. Suitable Lewis Acids include silicon compounds such as trimethylsilyl chloride and trimethylsilyl iodide; aluminum compounds such as aluminum chloride, trimethyl aluminum, diethyl aluminum chloride, ethyl aluminum dichloride, and diethyl aluminum cyanide; magnesium salts; and boron salts. Suitable solvents for the ring opening reaction include hydrocarbon solvents, such as, benzene, toluene, xylene, or cyclohexane; ethereal solvents such as ether, tetrahydrofuran, dioxane, or
dimethoxyethane; or halogenated hydrocarbons, such as, chlorobenzene, methylene chloride, carbon tetrachloride, chloroform, or dichloroethane.

After such halogenation, the first intermediate compound is reacted with a piperidine compound of the formula:

![Chemical Structure](image1.png)

under conditions effective to form the piperidine derivative compound having a keto group of the formula:

![Chemical Structure](image2.png)

This alkylation reaction is carried out in a suitable solvent preferably in the presence of a base and, optionally, in the presence of a catalytic amount of potassium iodide for about 4 to 120 hours at a temperature of about 70 C to the reflux temperature of the solvent. Suitable solvents for the alkylation reaction include alcohol solvents, such as methanol, ethanol, isopropyl alcohol, or n-butanol; ketone solvents, such as, methyl isobutyl ketone; hydrocarbon solvents, such as, benzene, toluene, or xylene; halogenated hydrocarbons, such as, chlorobenzene or methylene chloride; or dimethylformamide. Suitable bases for the alkylation reaction include inorganic bases, for example, sodium bicarbonate, potassium carbonate, or potassium bicarbonate or organic bases, such as a trialkylamine, for example, triethylamine or pyridine, or an excess of the piperidine compound can be used.

When R3 is —COOalkyl, the alkylation reaction is followed by base hydrolysis to convert R3 substituents that are —COOalkyl groups to —COOH groups. Such base hydrolysis involves treatment of the substantially pure piperidine derivative with an inorganic base, such as, sodium hydroxide in an aqueous lower alcohol solvent, such as, aqueous methanol, ethanol, isopropyl alcohol, or n-butanol at reflux temperature for about 1/2 hour to 12 hours.

Piperidine compounds where each of R1 and R2 is hydrogen or wherein R1 is hydroxy and R2 is hydrogen are commercially available or may be prepared according to procedures well known in the art (e.g. F. J. McCarty, C. H. Tilford, M. G. Van Campen, J. Am. Chem. Soc., 1961, 26, 4084). Piperidine compounds wherein R1 and R2 form a second bond between the carbon atoms bearing R1 and R2 may be prepared by dehydration of the corresponding compound wherein R1 is hydroxy by procedures generally known in the art.

Second Process For Converting Substantially Pure Regioisomer To Substantially Pure Piperidine Derivative Having A Keto Group

In another embodiment of the present invention, the substantially pure regioisomer of the formula:

![Chemical Structure](image3.png)

is reacted directly with a piperidine compound of the formula:

![Chemical Structure](image4.png)

under conditions effective to form the piperidine derivative compound having a keto group of the formula:

![Chemical Structure](image5.png)

This alkylation reaction is carried out in a suitable solvent preferably in the presence of a base and optionally in the presence of a Lewis Acid such as magnesium, cesium, or calcium salts or trimethylsilyl chloride or in the presence of a catalytic amount of potassium iodide for about 4 to 120 hours at a temperature of about 70 C to the reflux temperature of the solvent. Suitable solvents for the alkylation reaction include alcohol solvents, such as, methanol, ethanol, isopropyl alcohol, or n-butanol; ketone solvents, such as, methyl isobutyl ketone; hydrocarbon solvents, such as, benzene, toluene, or xylene; halogenated hydrocarbons, such as, chlorobenzene or methylene chloride; or dimethylformamide. Suitable bases for the alkylation reaction include inorganic bases, for example, sodium bicarbonate, potassium carbonate, or potassium bicarbonate or organic bases, such as a trialkylamine, for example, triethylamine or pyridine, or an excess of a compound of the piperidine compound may be used.
Processes for Reduction of Keto Group in Substantially Pure Piperidine Derivative

As discussed above, the process of the present invention is useful in producing substantially pure piperidine derivatives with either a keto group or a hydroxyl group. Derivatives with keto groups can be converted to similar compounds with hydroxyl groups by reduction reactions which are well known in the art.

Reduction can be carried out with sodium borohydride or potassium borohydride in lower alcohol solvents, such as, methanol, ethanol, isopropanol alcohol, or n-butanol.

When lithium aluminum hydride or diborane are used as reducing agents, suitable solvents are ethers, for example, diethyl ether, tetrahydrofuran, or dioxane. These reduction reactions are carried out at temperatures ranging from about 0°C to the reflux temperature of the solvent, and the reaction time varies from about 0.5 to 8 hours.

Catalytic reduction may also be employed using, for example, Raney nickel, palladium, platinum or rhodium catalysts in lower alcohol solvents, such as, methanol, ethanol, isopropanol alcohol, or n-butanol or acetic acid or their aqueous mixtures, or by the use of aluminum isopropoxide in isopropanol alcohol. Reduction using sodium borohydride is generally preferred over catalytic reduction when forming carboxylic acids or esters. When the starting material is an ester, lithium aluminum hydride is the preferred reducing agent, while diborane is preferred when starting with an acid.

When esters with hydroxyl groups have been formed, base hydrolysis can be used to produce a carboxylic acid. Such procedures are well known and generally involve treatment with an inorganic base, such as, sodium hydroxide or potassium hydroxide, in an aqueous lower alcoholic solvent, such as, aqueous methanol, ethanol, isopropanol alcohol, or n-butanol. Base hydrolysis is carried out at about the solvent reflux temperature for about 1/2 hour to 12 hours.

EXAMPLES

Example 1

Preparation of Ethyl 3- and 4-(4-chloro-1-oxobutyl)-α,α-dimethylphenylacetate

Aluminum chloride (44 g; 0.33 mol) was added slowly in portions to a solution of freshly distilled 4-chlorobutyl chloride (17 mL; 0.15 mol) in 460 mL of carbon disulfide at -10°C under a nitrogen atmosphere. The mixture was stirred for 15 minutes, then the cooling bath was removed and the mixture was allowed to warm to ambient temperature. The mixture was stirred for another 15 minutes more, then cooled again to -10°C and a solution of ethyl α,α-dimethylphenylacetate (26.6 g; 0.14 mol) in 70 mL of carbon disulfide was added dropwise. The mixture was maintained with stirring for 3 hr, then stirred overnight at room temperature.

The reaction mixture was partitioned between H₂O and CHCl₃. The combined organic portions were washed with saturated aqueous NaHCO₃ solution, dried over MgSO₄, filtered and concentrated in vacuo. The residue was dissolved in 800 mL of CH₃OH and 200 mL of H₂O was added 40 g of NaOH. The resulting mixture was refluxed for one hour. The cooled mixture was then concentrated in vacuo to remove the CH₂OH. The concentrate was diluted with H₂O and washed with two portions of EtOAc. The aqueous layer was acidified with concentrated HCl and extracted with two portions of EtOAc. The extracts were dried over MgSO₄, filtered, and concentrated in vacuo to afford 30.3 g of crude product.

The crude product was dissolved in 600 mL of EtOAc. 38 g of cinchonidine was added, and the mixture was stirred overnight. The resulting solids were filtered and washed with EtOAc and sucked dry under a rubber dam to afford 25 g of a tan solid.

The solids were partitioned between EtOAc and 2N HCl. The aqueous layer was extracted with EtOAc. The combined organics were dried over MgSO₄ filtered, and concentrated in vacuo to afford 12.6 g (77%) of 4-(4-iodo-1-oxobutyl)-α,α-dimethylphenylacetate.

Example 2

Preparation of 4-(4-iodo-1-oxobutyl)-α,α-dimethylphenylacetate acid

A solution of 10.5 g of 4-(cyclopropyl-oxo-methyl)-α,α-dimethylphenylacetacetic acid, prepared in accordance with Example 2, in 250 mL of CH₂Cl₂ was cooled in an ice-MeOH bath and 25 g of trimethylsilyl iodide was then added rapidly via pipette. The mixture was stirred in the ice bath for one hour, warmed to ambient temperature, and stirred for one hour. A solution of aqueous sodium bisulfite was then added and the mixture was stirred well. The phases were partitioned and the aqueous layer was extracted with CH₂Cl₂. The combined organics were washed with saturated aqueous NaCl, dried over MgSO₄, filtered, and concentrated in vacuo to afford 12.6 g (77%) of 4-(4-iodo-1-oxobutyl)-α,α-dimethylphenylacetacetic acid.

Example 3

Preparation of Methyl 4-(4-iodo-1-oxobutyl)-(α,α-dimethylphenylacetate

To a solution of 12.6 g of 4-(4-iodo-1-oxobutyl)-α,α-dimethylphenylacetacetic acid, prepared in accordance with Example 3, in 100 mL of Et₂O cooled in an ice bath, was added 40 mL of ethereal CH₂N₂. The mixture was stirred at 0°C for a few minutes, then let stand for 2 hr. A few drops of AcOH were added to decompose excess CH₂N₂, then the mixture was filtered and stripped to afford 12.6 g (96%) of methyl 4-(4-iodo-1-oxobutyl)-(α,α-dimethylphenylacetate.

Example 5

Preparation of Methyl 4-[4-[4-[(Hydroxydiphenylmethyl)-4-piperidinyl]-1-oxobutyl]-α,α-dimethylphenylacetate

A solution of 12.6 g of methyl 4-(4-iodo-1-oxobutyl)-α,α-dimethylphenylacetate, prepared in accordance with Example 4, in 500 mL of toluene in a one liter three neck flask with mechanical stirring was added 8.8 g of 4-(α,α-diphenyl)piperidinemethanol and 23 g of K₂CO₃ and the mixture was refluxed for 7 hr. The cooled reaction mixture was then filtered and concentrated in vacuo. The residue was dissolved in Et₂O and treated with excess ethereal HCl. The mixture was then concentrated to a solid. The solid was treated with EtOAc and collected by filtration. The product
was then partitioned between EtOAc and 2N Na₂CO₃. The organic layers were dried over MgSO₄, filtered, and concentrated in vacuo to afford 13.5 g (79%) of dimethylphenylacetate.

Example 6
Preparation of Methyl 4-[4-[4-(Hydroxydiphenylmethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetate

A solution of 13.5 g of methyl 4-[4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetate, prepared in accordance with Example 5, in 250 mL of CH₃OH was cooled in an ice-CH₃OH bath and 1.8 g of NaBH₄ was added in portions. After 1 hr, the mixture was concentrated to a solid. The residue was partitioned between EtOAc and saturated aqueous NaCl, and the ethyl acetate was removed in vacuo to afford 9.5 g (79%) of methyl 4-[4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetate as a foam.

Example 7
Preparation of 4-[4-[4-Hydroxydiphenylmethyl]-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetic Acid

To a solution of 9.5 g of methyl 4-[4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetate, prepared in accordance with Example 6, in 300 mL of CH₃OH and 150 mL of H₂O was added 10 g of NaOH. The mixture was refluxed for 1 hr, then cooled. The CH₃OH was removed in vacuo. The concentrate was diluted with H₂O and CHCl₃ and the pH adjusted to approximately 5.5 to 6.0. The phases were separated and the aqueous phase was extracted with CHCl₃. The combined organics were dried over MgSO₄, filtered, and stripped to afford 9.0 g of crude product.

The crude product was dissolved in CH₂Cl₂ and chromatographed on Davissil grade 633 silica gel, packed in methylene chloride and chloroform, and eluted with a gradient of 2% methanol to 25% methanol. The fraction containing the product was concentrated by treatment of the product with EtOAc. mp 199-203 C. Calc. for C₃₄H₄₃N⁰₄: C, 76.62; H, 5.75; N, 2.75. Found: C, 76.24; H, 7.76; N, 2.75.

Example 8
Preparation of Methyl 4-[4-[4-(Bis(4-methylphenyl)-1-oxobutyl)-1-piperidinyl]-1-oxobutyl]-α,α-dimethylphenylacetate

To a solution of 6.4 g (0.017 mol) of methyl 4-[4-[4-iodo-1-oxobutyl]-α,α-dimethylphenylacetate, prepared in accordance with Example 4, in 500 mL of toluene in a one liter round bottom flask equipped with a mechanical stirrer was added 5.1 g (0.017 mol) of 4-(α,α-bis(4-methylphenyl)piperidinidemethanol, followed by 11.8 g (0.086 mol) of solid potassium carbonate. The solution was heated to reflux for 24 hr. After cooling, the mixture was filtered and the toluene was removed in vacuo. The residue was partitioned between ethyl acetate and 2N sodium bicarbonate solution. The aqueous layer was extracted twice with ethyl acetate, the combined organic layers were dried with sodium sulfate and the ethyl acetate was removed in vacuo to provide 6.8 g (73%) of methyl 4-[4-[4-(bis(4-methylphenyl)-1-hydroxymethyl)-1-piperidinyl]-1-oxobutyl]-α,α-dimethylphenylacetate as a viscous, dark colored oil.

Example 9
Preparation of Methyl 4-[4-[4-(Bis(4-Methylphenyl)hydroxymethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetate

To a 10 C solution of 6.8 g (0.013 mol) of methyl 4-[4-[4-(bis(4-methylphenyl)hydroxymethyl)-1-piperidinyl]-1-oxobutyl]-α,α-dimethylphenylacetate, prepared in accordance with Example 8, in 150 mL of methanol in a 500 mL round bottom flask equipped with a mechanical stirrer was slowly added 0.86 g (0.023 mol) of sodium borohydride, and the reaction was stirred for 2 hr. The methanol was removed in vacuo and the residue was partitioned between ethyl acetate and aqueous sodium bicarbonate solution. The aqueous layer was extracted with ethyl acetate; the combined organic layers were dried with sodium sulfate, and the ethyl acetate was removed in vacuo to provide 6.9 g of a dark colored foam. The resultant material was purified by column chromatography (Davisil grade 633 silica gel, packed in methylene chloride, material applied in chloroform, and eluted with a gradient of 2% methanol to 5% methanol to methylene chloride) to afford 5.3 g (77%) of methyl 4-[4-[4-(bis(4-methylphenyl)hydroxymethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetate.

Example 10
Preparation of 4-[4-[4-(Bis(4-methylphenyl)hydroxymethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetic Acid

To 350 mL of methanol in a 1 L round bottom flask equipped with a mechanical stirrer was added 5.3 g (9.8 mmol) of methyl 4-[4-[4-[4-(bis(4-methylphenyl)hydroxymethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetate, prepared in accordance with Example 9, 5.1 g (0.13 mol) of solid sodium hydride, and 100 mL of water. The mixture was heated to reflux for 3 hr. After cooling, the methanol was removed in vacuo, and 6N hydrochloric acid was added dropwise until the solution was no longer basic (pH=7). The solution was extracted three times with ethyl acetate. The organic layers were combined and a white crystalline solid precipitated out of solution. The solid was washed with ether to provide 1.8 g (34%) of 4-[4-[4-[4-(bis(4-methylphenyl)hydroxymethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetic acid, as the dihydroxide, mp 208-215 C. Analysis. Calc. for C₃₄H₃₉N⁰₄·2H₂O: C, 72.18; H, 8.37; N, 2.47. Found: C, 72.02; H, 8.36; N, 2.41.

Example 11
Preparation of 4-[1-Hydroxy-4-iodobutyl]-α,α-dimethylphenylacetic acid

To a solution of 50 mg of 4-[4-[4-iodo-1-oxobutyl]-α,α-dimethylphenylacetic acid, prepared in accordance with Example 3, in 3 mL of methanol was added 50 mg of NaBH₄. The mixture was stirred for 30 minutes, acidified with 2N HCl, and the methanol removed in vacuo. The concentrate was extracted with EtOAc. The organics were
dried over Na$_2$SO$_4$, filtered, and concentrated to afford 40 mg of 4-(1-hydroxy-4-iodobutyl)-α,α-dimethylphenylacetic acid.

**Example 12**

Preparation of 4-[4-(4-Hydroxydiphenylmethyl)-1-piperidinyl]-1-oxobutyl]-α,α-dimethylphenylacetic acid

A mixture of 800 mg of 4-(4-halo-1-oxobutyl)-α,α-dimethylphenylacetic acid, prepared in accordance with Example 3, 800 mg of 4-(α,α-diphenyl)piperidinemethanol, and 2.4 g of K$_2$CO$_3$ in 25 mL of toluene was stirred for 48 hours at room temperature. The mixture was concentrated in vacuo. The residue was treated with EtOAc, filtered, and concentrated to afford 4-[4-(4-Hydroxydiphenylmethyl)-1-piperidinyl]-1-oxobutyl]-α,α-dimethylphenylacetic acid.

**Example 13**

Preparation of 4-[4-[4-Hydroxydiphenylmethyl]-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetic Acid

A mixture of 4-[4-[4-(3-Hydroxydiphenylmethyl)-1-piperidinyl]-1-oxobutyl]-α,α-dimethylphenylacetic acid, prepared in accordance with Example 12, and 300 mg of NaBH$_4$ in 25 mL of CH$_3$OH was stirred overnight at room temperature. The mixture was then concentrated in vacuo. The residue was partitioned between EtOAc and H$_2$O. The aqueous portion was treated with concentrated HCl until pH 6, then extracted with EtOAc. The organics were concentrated in vacuo. The residue was dissolved in EtOAc, filtered, and concentrated in vacuo to an oil. The oil was dissolved in CH$_3$OH and concentrated to a solid. The solid was slurried with EtOAc, filtered, and rinsed with EtOAc to afford 4-[4-[4-Hydroxydiphenylmethyl]-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylphenylacetic acid.

Although the invention has been described in detail for the purpose of illustration, it is understood that such detail is solely for that purpose, and variations can be made therein by those skilled in the art without departing from the spirit and scope of the invention which is defined by the following claims.

What is claimed:

1. A process of preparing a piperidine derivative compound of the formula:

   ![Chemical Structure](image)

   wherein

   - $R_1$ is hydrogen or hydroxy;
   - $R_3$ is hydrogen;
   - or $R_1$ and $R_3$ taken together form a second bond between the carbon atoms bearing $R_1$ and $R_3$;
   - $R_4$ is pH or COOR$_4$;
   - $R_4$ has 1 to 6 carbon atoms;
   - A, B, and D are the substituents of their aromatic rings, each of which may be different or the same, and are selected from the group consisting of hydrogen, halogens, alkyl, hydroxyl, alkoxy, or other substituents.

   said process comprising:

   providing a substantially pure regioisomer of the following formula:

   ![Regioisomer](image)

   converting the substantially pure regioisomer to the piperidine derivative compound with a piperidine compound of the formula:

   ![Piperidine Compound](image)

2. A process according to claim 1, wherein said providing comprises:

   acylating a starting compound of the formula:

   ![Starting Compound](image)

   wherein

   - $R_4$ is OR$_6$, -N(R$_6$)$_2$, and -SR$_6$;
   - $R_6$ is an alkyl with 1 to 6 carbons,

   with a compound of the formula:

   ![Compound](image)

   wherein

   - X is a halogen,

   under conditions effective to produce a first mixture of regioisomers of the formula:

   ![Regioisomers](image)

   hydrolyzing the first mixture of regioisomers under conditions effective to form a second mixture of a regio-
25

somers of the formula:

recovering from the second mixture of regioisomers the substantially pure regioisomer of the formula:

3. A process according to claim 2, wherein said recovering comprises:

- crystallizing from the second mixture of regioisomers a substantially pure regioisomer salt of the formula:

wherein \( X^+ \) is a Lewis Acid;

- isolating the substantially pure regioisomer salt;

- converting the substantially pure regioisomer salt to the substantially pure regioisomer of the formula:

4. A process according to claim 3, wherein \( X^+ \) is an alkali metal salt or an ammonium salt of the form \( \text{NR}_2\text{R}_3\text{R}_4 \) wherein \( \text{R}_7, \text{R}_8, \) and \( \text{R}_9 \) are individually hydrogen or a straight or branched alkyl of 1 to 6 carbon atoms, or an alkyl substituted at any position with a phenyl ring or a substituted phenyl ring.

5. A process according to claim 2, wherein said acylating is carried out by a Friedel-Crafts reaction using \( \text{AlCl}_3 \) catalyst.

6. A process according to claim 1 further comprising:

- reducing the piperidine derivative under conditions effective to form a hydroxylated piperidine derivative of the formula:

7. A process according to claim 6, wherein the hydroxylated piperidine derivative has the formula:

8. A process according to claim 6, wherein the hydroxylated piperidine derivative has the formula:

9. A process according to claim 1, wherein said converting comprises:

- halogenating the substantially pure regioisomer of the following formula:

under conditions effective to form a first intermediate compound of the formula:
wherein

X is a halogen and

reacting the first intermediate compound with a piperidine compound of the formula:

under conditions effective to form the piperidine derivative of the following formula:

10. A process according to claim 1, wherein said converting comprises:

reacting the substantially pure regioisomer of the following formula:

11. A process according to claim 1, wherein the piperidine derivative has the formula:

12. A process according to claim 1, wherein the piperidine derivative has the formula:
